What is the resolution of o the 70,000 images from the Fashion MNIST dataset?

●

- **28x28 Greyscale**
- 28x28 Color
- 82x82 Greyscale
- 100x100 Color

Why are there 10 output neurons in the Neural Network used as an example for the Computer Vision Problem?

- **There are 10 different labels**
- To make it train 10x faster
- Purely arbitrary
- To make it classify 10x faster

What does Relu do?

- It returns the negative of x
- **It only returns x if x is greater than zero**
- For a value x, it returns 1/x
- It only returns x if x is less than zero

Why do you split data into training and test sets?

- To make testing quicker
- **To test a network with previously unseen data**
- To train a network with previously unseen data
- To make training quicker

True or False: The on_epoch_end function sends a logs object with lots of great information about the current state of training at the start of every epoch

- **False**
- True

Why do you set the callbacks= parameter in your fit function?

- So that the training loops performs all epochs
- Because it accelerates the training
- **So, on every epoch you can call back to a code function**
